

Time Delay Relays

DEDICATED - INTERVAL

THD2 Series

Description

The THD2 Series combines accurate timing circuitry with high power solid-state switching. It can switch motors, lamps, and heaters directly without a contactor. You can reduce labor, component cost, and increase reliability with these small, easy-to-use, Digi-Power timers.

Operation (Interval)

Upon application of input voltage, the time delay begins. The output energizes during the time delay. At the end of the time delay, the output de-energizes and remains de-energized until input voltage is removed.

Reset: Removing input voltage resets the time delay and the output.

Features

- Microcontroller based
- High load currents up to 20A, 200A inrush
- Totally solid state and encapsulated
- Metalized mounting surface
- Compact, low cost design

Benefits

- Repeat Accuracy + / - 0.5%,
Factory calibration + / - 1%
- Allows direct control of motors, lamps and heaters without a contactor
- No moving parts to arc and wear out over time and encapsulated to protect against shock, vibration, and humidity
- Facilitates heat transfer in high current applications
- Allows flexibility for OEM applications and reduces labor and components costs

Function Diagram

External Resistance vs. Time Delay

This chart applies to externally adjustable part numbers.

The time delay is adjustable over the time delay range selected by varying the resistance across the R_T terminals; as the resistance increases the time delay increases.

When selecting an external R_T , add the tolerances of the timer and the R_T for the full time range adjustment.

Examples: 1 to 50 S adjustable time delay, select time delay range 1 and a 50 K ohm R_T . For 1 to 100 S use a 100 K ohm R_T .
